## Differentiation of the Cs in lung cancer: Cancer vs. COVID

Urgent referrals for cancer in general and for lung cancer specifically have fallen during the COVID-19 pandemic that will likely lead to an increase in mortality and morbidity from lung cancer.

Overlapping symptoms means that the message to patients about early diagnosis is negated by the messages necessary to control the COVID pandemic.

As well as attempting to clarify the distinction between lung cancer and COVID-19, there needs to be easy access for patients to have their symptoms assessed if they think they might have lung cancer. Current arrangements in primary care and on the NHS 111 services are unlikely to help patients present early and do not specifically address the issue of overlapping symptoms.

A Features more suggestive of lung cancer	B Indeterminate Features	C Features more suggestive of COVID-19 infection
Overlapping symptoms are <i>unaccompanied</i> by COVID-19 symptoms: Unexplained persistent cough Unexplained persistent breathlessness Fatigue of duration >4 weeks Persistent or recurrent chest infection May be <i>accompanied</i> by more specific red-flag symptoms of lung cancer including: haemoptysis, chest pain weight loss appetite loss And examination / other findings: finger clubbing	Cough, unclear onset and persistence Breathlessness, unclear onset and persistence Unclear if any fever Flu-like symptoms lasting longer than 3 weeks. Feeling of chest tightness Difficulty in taking a deep breath Fatigue with duration <4 weeks Recurrent chest infections with possible features of COVID-19	Acute onset of: Dry cough Breathlessness Fever Myalgia Loss of smell Loss of taste Close contact with a confirmed/ highly suspected case of COVID-19 Initial flu-like symptoms for 1-2 weeks with onset of respiratory symptoms from 7-10 days.
	No other clear red flag symptoms	

The following is a suggested mitigation for the overlapping symptoms of cough, breathlessness and fatigue.

<ul> <li>supraclavicular lymphadenopathy or persistent cervical lymphadenopathy</li> <li>chest signs consistent with lung cancer</li> <li>thrombocytosis.</li> </ul> Also consider risk factors for lung cancer: <ul> <li>smoking history</li> <li>Age</li> <li>Asbestos exposure</li> </ul>		
Action: Arrange an urgent nasal/oropharyngeal swab for SARS-CoV-2 PCR and if negative:	Action: Arrange a nasal/oropharyngeal swab for SARS- CoV-2 PCR and if negative:	<b>Action:</b> Manage patient according to the latest guidelines on the management of COVID-19.
Refer for Chest X-ray or direct to lung cancer service for CT and triage on the National Optimal Lung Cancer Pathway If PCR positive, manage according to current	Ask patient to self-isolate for 14 days and then review symptoms; if persistent refer as for <b>A</b> If PCR positive, manage according to current COVID-19 guidelines and review after 2 weeks	
COVID-19 guidelines and review after 2 weeks if hospital admission not required; consider 2 week wait referral in patient recovered from COVID-19 in whom lung cancer suspected If symptoms require urgent attention, consider emergency admission	if not admitted to hospital If symptoms require urgent attention, consider emergency admission
